

POWER BI 30 DAYS COURESE

Day 7 - Adding Visuals Column Chart

What is a Visual?

A Visual is a graphical representation of data in Power BI.

Examples:

- Column Chart
- Bar Chart
- Pie Chart

- Line Chart
- Table
- Card

Visuals help users understand data easily.

What is a Column Chart?

A Column Chart displays data using vertical bars (columns).

It is used to compare values across different categories.

Example

Product	Sales
Laptop	5000
Mobile	7000
Tablet	3000

Column Chart:

Why Use a Column Chart?

- Compare categories
- Show sales performance
- Identify highest and lowest values

- Easy to understand

Types of Column Charts

1. Clustered Column Chart

Columns are displayed side by side.

A Clustered Column Chart displays multiple columns side by side for easy comparison.

In this Chart:

- X-Axis = Groups (Group 1, Group 2)
- Y-Axis = Percentage of Patients
- Each color represents a different measure:
 - Red = Resting Heart Rate <110 bpm
 - Green = Improved QOL
 - Black = Mortality

Example:

Group 1

- Resting Heart Rate = 70%

- Improved QOL = 59%
- Mortality = 9%

Group 2

- Resting Heart Rate = 35%
- Improved QOL = 40%
- Mortality = 20%

Easy Definition (Interview Answer)

A Clustered Column Chart shows multiple columns side by side to compare values across different categories or groups.

Why Use It?

- ☒ Compare multiple measures together
- ☒ Compare different groups easily
- ☒ Identify highest and lowest values quickly

2. Stacked Column Chart

Values are stacked on top of each other.

A Stacked Column Chart shows the total value and also shows how different categories contribute to that total.

In this Chart:

- X-Axis = Region (East, West, Central, South)
- Y-Axis = Sales
- Colors represent Product Categories:
 - Furniture
 - Office Supplies
 - Technology

Example:

For East Region:

- Furniture = 196.33K
- Office Supplies = 211.78K
- Technology = 184.06K

Total Sales = 592.17K

All three categories are stacked in one column.

Easy Definition (Interview Answer)

A Stacked Column Chart displays total values using vertical bars and shows how each category contributes to the total value. 

Why Use It?

- ☒ Compare total sales between regions
- ☒ See category-wise contribution

3. 100% Stacked Column Chart

Shows percentage contribution.

A 100% Stacked Column Chart shows the percentage contribution of each category to the total.

In this Chart:

- X-Axis = Quarters (Q1, Q2, Q3, Q4)
- Y-Axis = Percentage (0% to 100%)
- Colors represent Regions:
 - East
 - West
 - North
 - South

Key Point

Each column always equals 100%.

It shows how much each region contributes to total sales, not the actual total sales.

Example

For Q1:

- East = 42K

- West = 48K
- North = 46K
- South = 32K

The chart converts these values into percentages and displays them within a 100% column.

Easy Definition (Interview Answer)

A 100% Stacked Column Chart shows the percentage contribution of different categories, where each column always represents 100%.

Why Use It?

- ☒ Compare percentage contribution
 - ☒ Analyze market share
 - ☒ Compare proportions across periods
 - ☒ Ignore total values and focus on percentages
-

Difference Between All Three

Chart Type	Purpose
Clustered Column Chart	Compare values side by side
Stacked Column Chart	Show total and category contribution
100% Stacked Column Chart	Show percentage contribution only

Easy Memory Trick

-  Clustered = Compare Values
 -  Stacked = Total + Contribution
 -  100% Stacked = Percentage Contribution Only
-

Steps to Create a Column Chart

Step 1

Go to Report View.

Step 2

Select Clustered Column Chart from Visualizations Pane.

Step 3

A blank chart appears on Canvas.

Step 4

Drag Category field to X-Axis.

Example:

Product Name

Step 5

Drag Measure field to Y-Axis.

Example:

Sales

Step 6

Column Chart is created.

Parts of a Column Chart

X-Axis

Shows categories.

Example:

- **Product**
 - **Customer**
 - **Region**
-

Y-Axis

Shows numerical values.

Example:

- Sales
 - Profit
 - Quantity
-

Data Labels

Shows values on top of columns.

Example:

5000
7000
3000

Legend

Shows different categories using colors.

Example:

- Online Sales
 - Offline Sales
-

Title

Heading of the chart.

Example:

Sales by Product

Formatting Column Chart

Select Chart → Format Visual

Change:

- Title
 - Color
 - Background
 - Border
 - Data Labels
 - X-Axis
 - Y-Axis
 - Legend
-

Interview Questions

Q1. What is a Visual in Power BI?

Answer:

A Visual is a graphical representation of data used for analysis and reporting.

Q2. What is a Column Chart?

Answer:

A Column Chart is a chart that uses vertical bars to compare values across categories.

Q3. Why do we use Column Charts?

Answer:

To compare values between different categories and identify trends or performance.

Q4. What are the types of Column Charts?

Answer:

- 1. Clustered Column Chart**
 - 2. Stacked Column Chart**
 - 3. 100% Stacked Column Chart**
-

Q5. What is X-Axis?

Answer:

The X-Axis displays categories such as Product, Region, or Customer.

Q6. What is Y-Axis?

Answer:

The Y-Axis displays numerical values such as Sales, Profit, or Quantity.

Q7. What is a Legend?

Answer:

A Legend explains colors used in a chart.

Q8. What are Data Labels?

Answer:

Data Labels display values directly on the chart.

Q9. What is the difference between Clustered and Stacked Column Chart?

Clustered Column Chart	Stacked Column Chart	100% Stacked Column Chart
Columns are side by side	Columns are stacked	Columns are stacked as percentages
Compare actual values	Show total + contribution	Show percentage contribution
Easy to compare categories	Easy to see total sales	Easy to compare percentages
Total is not shown together	Total is shown	Every column = 100%

Q10. What is 100% Stacked Column Chart?

Answer:

A chart where each column represents 100% and shows percentage contribution of categories.

Most Important Interview Question

Q11. Why do we use a Column Chart in Power BI?

Answer:

A Column Chart is used to compare values across different categories using vertical bars. It helps users quickly identify highest, lowest, and overall performance trends.
