

POWER BI 30 DAYS COURESE

Day 1-5 Practise interview type que & ans

Day 1 - Introduction to Power BI (Interview Questions & Answers)

Q1. What is Power BI?

Answer:

Power BI is a Business Intelligence (BI) tool developed by Microsoft that helps users connect, analyze, visualize, and share data through reports and dashboards.

Q2. What is Business Intelligence (BI)?

Answer:

Business Intelligence is the process of collecting, analyzing, and presenting data to help businesses make better decisions.

Q3. Why is Power BI called a Cloud-Based BI Tool?

Answer:

Because Power BI allows users to access reports and dashboards from anywhere through the internet.

Q4. Which company developed Power BI?

Answer:

Microsoft.

Q5. Name some data sources that Power BI can connect to.

Answer:

- Excel
- SQL Server
- CSV Files
- Cloud Services

- Databases
-

Q6. What is Data Integration?

Answer:

Data Integration means combining data from multiple sources into a single report or dashboard.

Q7. What is a Dashboard?

Answer:

A Dashboard is a single-page visual display of important business information using charts, graphs, KPIs, and filters.

Q8. What is an Interactive Dashboard?

Answer:

An Interactive Dashboard allows users to click charts, filters, and slicers to explore data.

Q9. What is a Report in Power BI?

Answer:

A Report is a collection of visualizations spread across one or more pages used to analyze data.

Q10. What are KPIs?

Answer:

KPIs (Key Performance Indicators) are measures used to track business performance and progress.

Example:

- Sales
- Profit
- Revenue
- Customer Count

Q11. What are the benefits of Power BI?

Answer:

- 1. Easy to Use**
 - 2. Real-Time Updates**
 - 3. Mobile Access**
 - 4. Interactive Dashboards**
 - 5. Data Connectivity**
-

Q12. What does Drag and Drop mean in Power BI?

Answer:

Drag and Drop means moving fields from the Fields Pane to the report area to create visuals without coding.

Q13. What are Real-Time Updates?

Answer:

Real-Time Updates allow Power BI to show the latest data whenever the source data changes.

Q14. How does Power BI provide Real-Time Updates?

Answer:

Power BI connects directly to data sources and refreshes reports automatically or on schedule.

Q15. What is Mobile Access in Power BI?

Answer:

Power BI reports and dashboards can be viewed on mobile devices using the Power BI Mobile App.

Q16. What is Raw Data?

Answer:

Raw Data is original, unprocessed data collected from sources such as Excel files, databases, and applications.

Q17. Give examples of Raw Data.

Answer:

- Excel files
 - Database tables
 - CSV files
 - Application data
-

Q18. Why is Raw Data important?

Answer:

Raw Data is the foundation used for cleaning, transformation, analysis, and reporting.

Power BI Installation

Q19. How can you download Power BI Desktop?

Answer:

Power BI Desktop can be downloaded:

1. From the Microsoft official website
 2. From the Microsoft Store
-

Q20. Is Power BI Desktop free?

Answer:

Yes, **Power BI Desktop** is free for learning and report development.

Q21. What is the file extension of a Power BI file?

Answer:
.pbix

Power BI Interface

Q22. What are Tabs in Power BI?

Answer:
Tabs contain different menus and tools such as Home, Insert, Modeling, View, and Help.

Q23. What is the Ribbon?

Answer:
The Ribbon contains buttons and commands used to perform tasks like importing data, refreshing reports, and creating visuals.

Q24. What is Canvas?

Answer:
Canvas is the main working area where reports and dashboards are created.

Q25. What can be added to the Canvas?

Answer:

- Charts
 - Tables
 - KPIs
 - Images
 - Cards
-

Q26. What is a Pane?

Answer:
A Pane is a section on the right side of Power BI used for managing visualizations, fields, and filters.

Q27. Name the main panes in Power BI.

Answer:

- **Visualizations Pane**
 - **Fields Pane**
 - **Filters Pane**
-

Q28. What are Views in Power BI?

Answer:

Views allow users to work with reports, data, and relationships.

Q29. Name the three main views in Power BI.

Answer:

1. **Report View**
 2. **Data View**
 3. **Model View**
-

Q30. What is Report View?

Answer:

Report View is used to create and design reports and visualizations.

Q31. What is Data View?

Answer:

Data View is used to see the data tables loaded into Power BI.

Q32. What is Model View?

Answer:

Model View is used to create and manage relationships between tables.

Q33. What is Page Navigation?

Answer:

Page Navigation is used to move between different report pages.

Most Important Interview Question

Q34. Why do companies use Power BI?

Answer:

Companies use Power BI to connect data from multiple sources, create interactive reports and dashboards, analyze business performance, and make data-driven decisions.

Day 2 - Import Data into Power BI (Interview Questions & Answers)

Q1. What is Import Data in Power BI?

Answer:

Importing data means bringing data from files, databases, or online sources into Power BI for analysis and reporting.

Q2. What are the three ways to import data in Power BI?

Answer:

1. Get Data Option
 2. Import Data from Excel Tile
 3. Data/Fields Pane
-

Q3. What is the Get Data option?

Answer:

Get Data is used to connect Power BI with different data sources such as Excel, SQL Server, CSV files, and web data.

Q4. What happens after selecting a data source?

Answer:

You can either:

- Click Load (if data is already clean)
 - Click Transform Data (if data needs cleaning)
-

Q5. What is the difference between Load and Transform Data?

Answer:

Load	Transform Data
Loads data directly	Opens Power Query
Used for clean data	Used for dirty data
No changes applied	Data can be cleaned and transformed

Q6. What is ETL?

Answer:

ETL stands for:

- **E = Extract**
- **T = Transform**
- **L = Load**

It is the process of collecting, cleaning, and loading data for analysis.

Q7. Explain Extract in ETL.

Answer:

Extract means collecting data from different sources such as:

- **Excel**
 - **Database**
 - **Websites**
 - **Cloud Services**
-

Q8. Explain Transform in ETL.

Answer:

Transform means cleaning and modifying data.

Examples:

- Remove duplicates
 - Remove blank rows
 - Fix errors
 - Change data types
-

Q9. Explain Load in ETL.

Answer:

Load means storing the cleaned data into Power BI for reporting and analysis.

Q10. Which ETL tool is used in Power BI?

Answer:

Power Query is the ETL tool used in Power BI.

Power Query

Q11. What is Power Query?

Answer:

Power Query is an ETL tool in Power BI used to import, clean, transform, and load data.

Q12. What are the main uses of Power Query?

Answer:

1. Import Data
 2. Clean Data
 3. Transform Data
 4. Load Data
-

Q13. Why is Power Query important?

Answer:

Power Query helps prepare raw data before creating reports and dashboards.

Q14. Give examples of data cleaning in Power Query.

Answer:

- Remove blank rows
 - Remove duplicates
 - Fix errors
 - Remove unwanted columns
-

Q15. Give examples of data transformation in Power Query.

Answer:

- Rename columns
 - Split columns
 - Merge tables
 - Change data types
 - Apply filters
-

Q16. What are the features of Power Query?

Answer:

- Easy to use
 - No coding required
 - Step-by-step transformations
 - Automatically saves applied steps
-

Data Sources

Q17. What is an Excel Workbook data source?

Answer:

Excel Workbook is used to import Excel files into Power BI.

Examples:

- Sales Data
 - Employee Records
 - Student Marks
-

Q18. What is Power BI Semantic Model?

Answer:

A Semantic Model allows users to connect to existing Power BI datasets and reuse data without creating it again.

Q19. What is a Dataflow?

Answer:

A Dataflow is a cloud-based tool used to clean, transform, and prepare data before reporting.

Q20. What is Dataverse?

Answer:

Dataverse is Microsoft's secure cloud database used to store and manage business data.

Example:

- Customer Records
 - Company Information
-

Q21. What is SQL Server?

Answer:

SQL Server is a database system used to store large amounts of business data.

Power BI can connect directly to SQL Server.

Q22. What are the two modes available when connecting SQL Server?

Answer:

1. Import Mode
 2. DirectQuery Mode
-

Q23. What is Import Mode?

Answer:

Import Mode copies data into Power BI and provides fast performance.

Q24. What is DirectQuery Mode?

Answer:

DirectQuery Mode keeps data in the database and retrieves data in real time.

Q25. Difference between Import Mode and DirectQuery Mode?

Import Mode	DirectQuery Mode
Data stored in Power BI	Data stored in Database
Faster	Slower
Requires Refresh	Real-Time Data
Best for Small/Medium Data	Best for Large Data

Q26. What is Analysis Services?

Answer:

Analysis Services is used for advanced business analysis and enterprise-level reporting.

Q27. What is a CSV File?

Answer:

CSV (Comma Separated Values) is a text file used to store tabular data separated by commas.

Q28. What is the Web Data Source?

Answer:

The Web data source is used to import tables and information from websites.

Q29. What is OData Feed?

Answer:

OData Feed is used to connect Power BI to online services and APIs for live data.

Q30. What is a Blank Query?

Answer:

A Blank Query allows users to create custom queries manually in Power Query.

Q31. Why do we use More... option in Get Data?

Answer:

The More option provides access to additional data sources such as:

- Oracle
 - MySQL
 - PostgreSQL
 - SharePoint
 - Google Analytics
-

Most Important Interview Questions

Q32. Why do we use Power Query?

Answer:

Power Query is used to import, clean, transform, and load data before creating reports and dashboards.

Q33. What is the role of ETL in Power BI?

Answer:

ETL helps extract data from different sources, transform it into a useful format, and load it into Power BI for analysis and reporting.

Q34. What is the difference between Raw Data and Clean Data?

Answer:

Raw Data	Clean Data
Original Data	Processed Data
Contains errors and duplicates	Errors removed
Not ready for analysis	Ready for reporting

Q35. What is the first step before creating a dashboard?

Answer:

The first step is importing and preparing the data using Power Query (ETL process).

Day 3 - Data Transformation (Interview Questions & Answers)

Q1. What is Data Transformation?

Answer:

Data Transformation is the process of cleaning, modifying, and converting data into a useful format before analysis.

Q2. Why do we perform Data Transformation?

Answer:

To improve data quality and make data ready for reporting and analysis.

Q3. Which tool is used for Data Transformation in Power BI?

Answer:

Power Query.

Q4. Why did we click Transform Data instead of Load?

Answer:

Because the Customer Details file contained inconsistent values such as:

- G
- Gold
- R
- Regular

The data needed cleaning before loading.

Q5. When should we click Load?

Answer:

When the data is already clean and does not require any transformation.

Q6. What is inconsistent data?

Answer:
Inconsistent data means the same information is stored in different formats.

Example:

Member Type

Gold

G

Gold

G

Here G and Gold represent the same value.

Q7. How do you make inconsistent data consistent?

Answer:
Using the Replace Values option in Power Query.

Q8. What is Replace Values?

Answer:
Replace Values is used to replace one value with another value.

Example:

G → Gold

R → Regular

Q9. Why do we use Match Entire Cell Contents?

Answer:
It ensures Power Query replaces only the exact value and not part of another word.

Q10. What happens when you click Close & Apply?

Answer:

All transformations are saved and the cleaned data is loaded into Power BI.

Q11. What is the difference between a Table and a Query?

Answer:

Power Query	Power BI
Query	Table

Easy Answer:

In Power Query we call it a Query.

After loading into Power BI it becomes a Table.

Import Mode & DirectQuery Mode

Q12. What are the two modes available while connecting SQL Server?

Answer:

1. Import Mode
 2. DirectQuery Mode
-

Q13. What is Import Mode?

Answer:

Import Mode copies data from the database and stores it inside Power BI.

Q14. What is DirectQuery Mode?

Answer:

DirectQuery Mode keeps data in the database and retrieves data live when needed.

Q15. Which mode is faster?

Answer:

Import Mode.

Q16. Which mode provides real-time data?

Answer:
DirectQuery Mode.

Q17. Which mode is best for large datasets?

Answer:
DirectQuery Mode.

Q18. Which mode stores data in Power BI?

Answer:
Import Mode.

Q19. Difference between Import Mode and DirectQuery Mode?

Answer:

Import Mode	DirectQuery Mode
Data stored in Power BI	Data stored in Database
Faster	Slower
Requires Refresh	Real-Time
Larger PBIX File	Smaller PBIX File
Best for Small/Medium Data	Best for Large Data

Applied Steps

Q20. What are Applied Steps?

Answer:
Applied Steps store every transformation performed in Power Query.

Q21. Where can you find Applied Steps?

Answer:

On the right side of Power Query under Query Settings.

Q22. Does Ctrl + Z work in Power Query?

Answer:

No, Ctrl + Z does not work like Excel.

Q23. How do you undo changes in Power Query?

Answer:

Remove or delete the required Applied Step.

Q24. How can you undo the Replace Value step?

Answer:

Click the X beside the Replace Value step in Applied Steps.

Q25. Why are Applied Steps important?

Answer:

They keep track of all transformations and allow users to modify or remove any step.

Data Checking in Power Query

Q26. What are the two modes used for data checking?

Answer:

1. Filter
 2. View
-

Q27. What is Filter?

Answer:

Filter is used to display only specific data and hide unwanted data.

Q28. Why do we use Filters?

Answer:

To analyze only the required records.

Q29. What is the shortcut key for Filter?

Answer:

Ctrl + Shift + L

Q30. What does Ctrl + Shift + L do?

Answer:

It turns Filters ON or OFF.

Q31. What is View in Power Query?

Answer:

View helps inspect and analyze data quality.

Q32. What options are available under View?

Answer:

- **Column Quality**
 - **Column Distribution**
 - **Column Profile**
-

Q33. What is Column Quality?

Answer:

Column Quality shows:

- **Valid values**

- Error values
 - Empty values
-

Q34. What is Column Distribution?

Answer:

Column Distribution shows unique and duplicate values in a column.

Q35. What is Column Profile?

Answer:

Column Profile provides detailed information about a column such as:

- Data type
 - Errors
 - Statistics
 - Value distribution
-

Q36. Why do we use View options?

Answer:

To identify:

- Null values
 - Errors
 - Duplicate values
 - Data quality issues
-

Most Important Interview Questions

Q37. Why do we use Transform Data?

Answer:

Transform Data is used to clean, modify, and prepare data before loading it into Power BI.

Q38. What is the difference between Load and Transform Data?

Answer:

Load	Transform Data
Loads data directly	Opens Power Query
No cleaning	Data cleaning possible
For clean data	For dirty/inconsistent data

Q39. What is the purpose of Power Query?

Answer:

Power Query is used to import, clean, transform, and load data into Power BI.

Q40. Explain Data Transformation in one line.

Answer:

Data Transformation is the process of cleaning and converting raw data into a useful format for reporting and analysis.

Day 4 - Append Data (Important Interview Questions & Answers)

Source: Your uploaded Day 4 notes.

Q1. What is Append in Power BI?

Answer:

Append is used to combine two or more tables by adding rows from one table below another table.

Q2. What is the difference between Append and Merge?

Append	Merge
Adds Rows	Adds Columns
Vertical Combination	Horizontal Combination
Increases Records	Increases Fields

Answer:

Append adds rows, whereas Merge adds columns based on a common column.

Q3. What is the condition for Append?

Answer:

The tables should have the same or similar column names and structure.

Q4. What does "Append adds rows" mean?

Answer:

Append adds new records below existing records.

Example

Before:

Name
Ram
Ravi

After Append:

Name
Ram
Ravi
Amit
Neha

The number of rows increases.

Q5. What does "Append does not add columns" mean?

Answer:

Append only adds rows. It does not create new columns.

Adding columns is called Merge.

Q6. Why do we use Folder as a data source?

Answer:

Folder is used when multiple files need to be combined automatically into one table.

Q7. What does the Content column contain?

Answer:

The Content column contains binary data of the files.

Q8. What is Binary Data?

Answer:

Binary data is the raw file data stored in Power BI before extracting its contents.

Q9. Why do we use Excel.Workbook([Content])?

Answer:

Excel.Workbook([Content]) extracts sheets and table data from the binary Content column.

Q10. Why do we remove other columns?

Answer:

To keep only required columns and remove unnecessary columns.

Q11. What is the purpose of Expand Column?

Answer:

Expand is used to extract data stored inside tables, records, or lists.

Q12. Explain Workbook → Sheet → Table.

Answer:

- Workbook = Excel File
 - Sheet = Worksheet inside Excel
 - Table = Actual Data
-

Q13. Why do we use "Use First Row as Headers"?

Answer:

To convert the first row values into column names.

Q14. Why do errors occur after promoting headers?

Answer:

Errors occur when the data type does not match the actual value.

Example

A Number column contains text like:

Order ID

This causes an error.

Q15. How can you identify errors in Power Query?

Answer:

Using:

- Column Quality
- Column Distribution
- Column Profile

under the View tab.

Q16. How do you remove errors in Power Query?

Answer:

Right-click the column and select Remove Errors.

Q17. What is Column Quality?

Answer:

Column Quality shows:

- Valid values
- Error values
- Empty values

in percentage format.

Q18. What is Column Distribution?

Answer:

Column Distribution shows:

- Unique values
 - Duplicate values
 - Frequency of data
-

Q19. What is Column Profile?

Answer:

Column Profile provides detailed information about a column such as:

- Data Type
 - Errors
 - Statistics
 - Value Distribution
-

Q20. What happens when you click Close & Apply?

Answer:

The transformed data is loaded from Power Query into Power BI.

Most Important Interview Question

Q21. Why did we use Append in this project?

Answer:

We had multiple monthly order files (April, February, etc.) stored inside a folder. Using Append, we combined all monthly files into a single Orders table for reporting and analysis.

Q22. What is the difference between Append and Merge with an example?

Answer:

Append

Customer
A
B

Customer
C
D

Result:

Customer
A
B
C
D

Rows increase.

Merge

Customer ID	Name
101	Ram

•

Customer ID	City
101	Delhi

Result:

Customer ID	Name	City
101	Ram	Delhi

Columns increase.

Day 5 - Modeling (Additional Important Interview Questions)

Q1. What is Modeling?

Answer:

Modeling is the process of creating relationships between tables in Power BI.

Q2. What is a Relationship?

Answer:

A relationship is a connection between two tables using a common column.

Example:

Customer Details[Customer ID]
|
Orders Data[Customer ID]

Q3. Why do we create Relationships?

Answer:

- Combine data from multiple tables
 - Create accurate reports
 - Improve analysis
 - Build dashboards correctly
 - Avoid duplicate data
-

Q4. What is Model View?

Answer:

Model View is used to:

- Create relationships
- Edit relationships
- Delete relationships

- View table connections
-

Q5. What is a Primary Key?

Answer:

A Primary Key contains unique values and is used on the One (1) side of a relationship.

Example:

Customer ID

101

102

103

No duplicates.

Q6. What is a Foreign Key?

Answer:

A Foreign Key contains duplicate values and is used on the Many (*) side of a relationship.

Example:

Customer ID

101

101

102

Duplicates are allowed.

Q7. What is Cardinality?

Answer:

Cardinality defines how tables are related to each other.

Q8. What are the types of Cardinality?

One-to-Many (1:*)

One customer can place many orders.

Many-to-One (*:1)

Many orders belong to one customer.

One-to-One (1:1)

One record matches one record.

Many-to-Many (:)

Many records match many records.

Q9. Which relationship is most commonly used?

Answer:

One-to-Many (1:*)

Q10. What is One-to-One Relationship?

Answer:

One record in one table matches exactly one record in another table.

Example:

Employee ID

101

matches

Employee ID

101

Q11. What is Many-to-Many Relationship?

Answer:

Many records in one table can match many records in another table.

Example:

One Student → Many Subjects

One Subject → Many Students

Q12. What are Filters?

Answer:

Filters are used to show only required data and hide unwanted data.

Q13. Why do we use Filters?

Answer:

- **Show specific data**
 - **Analyze data easily**
 - **Hide unnecessary records**
 - **Create focused reports**
-

Q14. What are the types of Filters?

Answer:

- 1. Visual Level Filter**
 - 2. Page Level Filter**
 - 3. Report Level Filter**
-

Q15. What is Visual Level Filter?

Answer:

It affects only one visual or chart.

Q16. What is Page Level Filter?

Answer:

It affects all visuals on the current page.

Q17. What is Report Level Filter?

Answer:
It affects all pages and visuals in the report.

Q18. What is Cross Filter Direction?

Answer:
Cross Filter Direction decides how filters travel between related tables.

Q19. What is Single Direction?

Answer:
The filter moves in one direction only.

Example:

Customer → Orders

Customer can filter Orders.

Orders cannot filter Customer.

Q20. What is Both Direction?

Answer:
Filters move in both directions.

Example:

Customer ↔ Orders

Both tables can filter each other.

Q21. What is Active Relationship?

Answer:
An Active Relationship is automatically used by Power BI.

Symbol:

Solid Line

Q22. What is Inactive Relationship?

Answer:

An Inactive Relationship exists but is not automatically used by Power BI.

Symbol:

Dotted Line

Q23. Why is Ship Date inactive?

Answer:

Because Order Date and Ship Date are connected to the same Calendar table.

Power BI allows only one active relationship between the same two tables.

Q24. Why does Power BI allow only one Active Relationship?

Answer:

To avoid confusion while calculating data.

Power BI would not know whether to use:

- Order Date
 - Ship Date
-

Q25. Which DAX function is used for an inactive relationship?

Answer:

USERRELATIONSHIP()

Q26. What is Auto Detect Relationship?

Answer:

Power BI automatically creates relationships when common columns are found.

Q27. What if Auto Detect does not work?

Answer:

Create the relationship manually.

Q28. How do you create a relationship manually?

Answer:

1. Open Model View
 2. Select common column
 3. Drag to matching column
 4. Select Cardinality
 5. Select Cross Filter Direction
 6. Click OK
-

Q29. What is Edit Relationship?

Answer:

Edit Relationship is used to modify an existing relationship.

Q30. What can be changed in Edit Relationship?

Answer:

- Cardinality
 - Cross Filter Direction
 - Active/Inactive Status
-

Q31. What is Delete Relationship?

Answer:

Delete Relationship removes the connection between two tables.

Q32. How do you delete a relationship?

Answer:

Right Click Relationship Line → Delete

Q33. What is Star Schema?

Answer:

Star Schema is a data model where one Fact Table is connected to multiple Dimension Tables.

Q34. Why is Star Schema recommended?

Answer:

- **Faster performance**
 - **Easy to understand**
 - **Easy to maintain**
 - **Better reporting**
-

Q35. What is a Fact Table?

Answer:

A Fact Table contains:

- **Sales**
- **Profit**
- **Quantity**
- **Revenue**

and other numerical data.

Q36. What is a Dimension Table?

Answer:

A Dimension Table contains:

- **Customer Name**
- **Product Name**
- **Region**

- Date

and other descriptive information.

Q37. How do you identify a Fact Table?

Answer:

Fact Tables contain:

- Numerical data
 - Transactions
 - Duplicate foreign keys
-

Q38. How do you identify a Dimension Table?

Answer:

Dimension Tables contain:

- Descriptive information
 - Unique values
-

Q39. What is the One Side in a relationship?

Answer:

The table containing unique values.

Usually a Dimension Table.

Q40. What is the Many Side in a relationship?

Answer:

The table containing duplicate values.

Usually a Fact Table.

Q41. Why did we create a relationship between Customer Details and Orders Data?

Answer:

Because Customer Name exists in Customer Details but not in Orders Data.

Using Customer ID, Power BI can fetch Customer Name.

Q42. What happens if a relationship is deleted?

Answer:

Reports may show incorrect results because tables are no longer connected.

Q43. Why are Relationships important?

Answer:

Relationships help Power BI combine data from multiple tables and generate accurate reports and dashboards.

Q44. What is the extension of a Power BI file?

Answer:

.pbix

Q45. What does a .pbix file contain?

Answer:

- Data
 - Relationships
 - Queries
 - DAX Measures
 - Reports
 - Dashboards
-

Q46. Why should we save a .pbix file?

Answer:

- Avoid losing work
- Reopen projects later

- Share reports
 - Continue development
-

Most Important Interview Question

Q47. Why is Relationship important in Power BI?

Answer:

Relationships connect tables using common columns. Without relationships, Power BI cannot combine data correctly, resulting in wrong charts and reports. Relationships help create accurate dashboards and business insights. 🚀

or

Q12. Why do we create relationships in Power BI?

Answer:

Relationships help Power BI:

- Combine data from multiple tables
 - Create accurate reports
 - Build dashboards correctly
 - Avoid duplicate data
-

Q13. What is Model View?

Answer:

Model View is used to:

- Create relationships
 - Edit relationships
 - Delete relationships
 - View table connections
-

Q14. Which column is used to create relationships?

Answer:

A common column available in both tables.

Example.

Customer Details → customer_id
Orders Data → customer_id

Q15. What is One Side in a relationship?

Answer:

The One Side contains unique values and is usually a Dimension Table.

Example:

Customer ID

101

102

103

No duplicates.

Q16. What is Many Side in a relationship?

Answer:

The Many Side contains duplicate values and is usually a Fact Table.

Example:

Customer ID

101

101

102

Duplicates are allowed.

Q17. Why is Customer Details called a Dimension Table?

Answer:

Because it contains descriptive information such as:

- Customer Name

- Customer ID
- Customer Type

and contains unique values.

Q18. Why is Orders Data called a Fact Table?

Answer:

Because it contains:

- Sales
- Profit
- Quantity
- Order Amount

and transactional data.

Q19. How do you identify a Fact Table?

Answer:

Fact Tables contain:

- Numerical data
- Transactional records
- Duplicate foreign keys

Examples:

- Sales
 - Profit
 - Quantity
 - Revenue
-

Q20. How do you identify a Dimension Table?

Answer:

Dimension Tables contain:

- Descriptive information
- Unique values

Examples:

- Customer Name
 - Product Name
 - Region
 - Date
-

Q21. Why is One-to-Many the most common relationship?

Answer:

Because one entity usually has multiple transactions.

Example:

One Customer → Many Orders

One Product → Many Sales

One Restaurant → Many Orders

Q22. What is the symbol for One-to-Many?

Answer:

1 → *

Where:

- 1 = Unique values
 - - = Duplicate values
-

Q23. What happens if no relationship exists between tables?

Answer:

Power BI cannot combine data correctly.

Result:

- Wrong charts
 - Wrong calculations
 - Incorrect reports
-

Q24. Why are relationships important?

Answer:

Relationships help Power BI create accurate reports and dashboards using data from multiple tables.

Q25. What happens if you delete a relationship?

Answer:

Power BI loses the connection between tables.

This may cause:

- Incorrect results
 - Incorrect charts
 - Data mismatch
-

Q26. Why did we create a relationship between Customer Details and Orders Data?

Answer:

Because Orders Data contains Customer ID but not Customer Name.

Using Customer ID, Power BI can fetch Customer Name from Customer Details.

Q27. How do you create a relationship manually?

Answer:

Steps:

1. Open Model View
2. Select common column

3. Drag and drop onto matching column
 4. Select Cardinality
 5. Select Cross Filter Direction
 6. Click OK
-

Q28. What is Auto Detect Relationship?

Answer:

Auto Detect automatically creates relationships when Power BI finds matching columns.

Q29. What if Auto Detect does not work?

Answer:

Create the relationship manually using Model View.

Q30. What is the difference between Auto Relationship and Manual Relationship?

Auto Relationship	Manual Relationship
Created automatically	Created by user
Uses common columns	User selects columns
Faster	More control

Q31. What is Cross Filter Direction?

Answer:

Cross Filter Direction decides how filters move between related tables.

Q32. Difference between Single and Both Cross Filter Direction?

Single	Both
Filter moves one way	Filter moves both ways

Single	Both
Simpler	More flexible
Better performance	Can be slower

Q33. What is Active Relationship?

Answer:

An Active Relationship is used automatically by Power BI.

Symbol:

Solid Line

Q34. What is Inactive Relationship?

Answer:

An Inactive Relationship exists but Power BI does not use it automatically.

Symbol:

Dotted Line

Q35. Why does Power BI allow only one active relationship?

Answer:

To avoid confusion when multiple columns connect the same tables.

Example:

Orders Table

|

Order Date

Ship Date

|

Calendar Table

Power BI must choose one relationship to use automatically.

Q36. Which DAX function is used to activate an inactive relationship?

Answer:

USERRELATIONSHIP()

Q37. What is Star Schema?

Answer:

Star Schema is a data model where one Fact Table is connected to multiple Dimension Tables.

Q38. Why is Star Schema recommended?

Answer:

Because it:

- Improves performance
 - Simplifies reporting
 - Makes relationships easier to understand
-

Q39. What is the extension of a Power BI file?

Answer:

.pbix

Q40. What does a .pbix file contain?

Answer:

A .pbix file contains:

- Data
 - Relationships
 - Queries
 - DAX Measures
 - Reports
 - Dashboards
-

Q41. Why should we save a Power BI file?

Answer:

To:

- Avoid losing work
 - Reopen projects later
 - Share projects
 - Continue report development
-

Most Important Interview Question

Q42. Why is Relationship important in Power BI?

Answer:

Relationships connect tables using common columns. Without relationships, Power BI cannot combine data correctly, resulting in incorrect reports and dashboards. Relationships ensure accurate analysis and reporting. 🚀
