

POWER BI 30 DAYS COURESE

Day 3 – Data Transformation

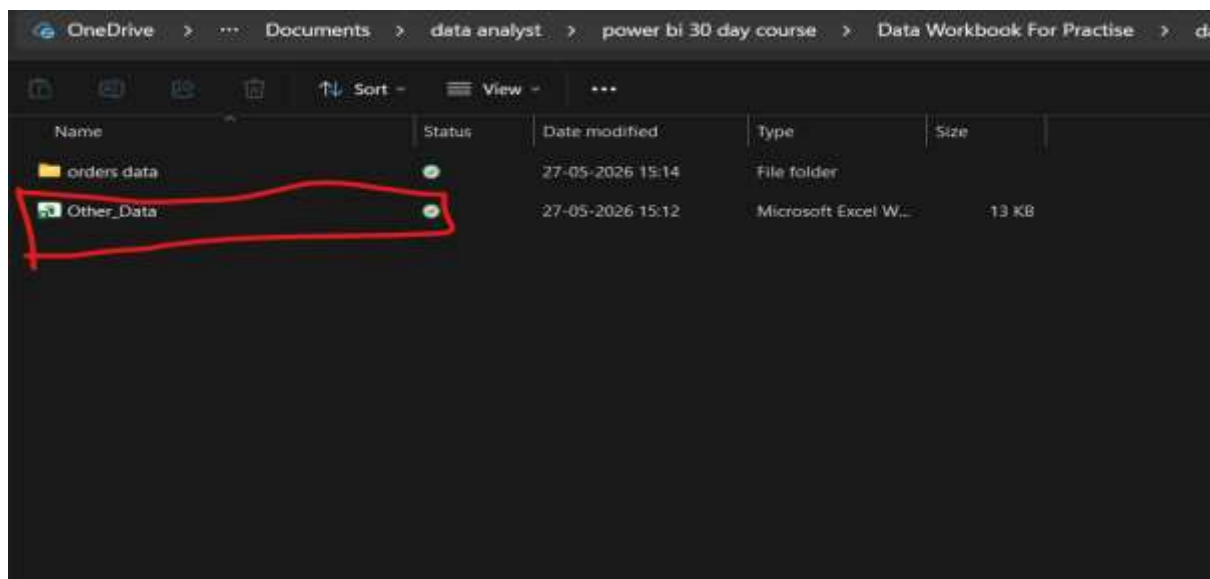

Import Data in Power BI

Import Data from Excel Tile

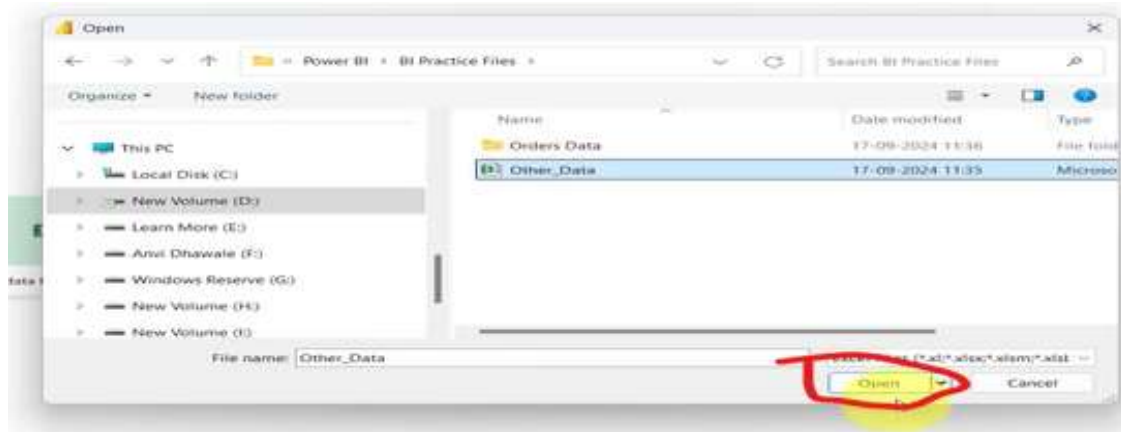

Steps:

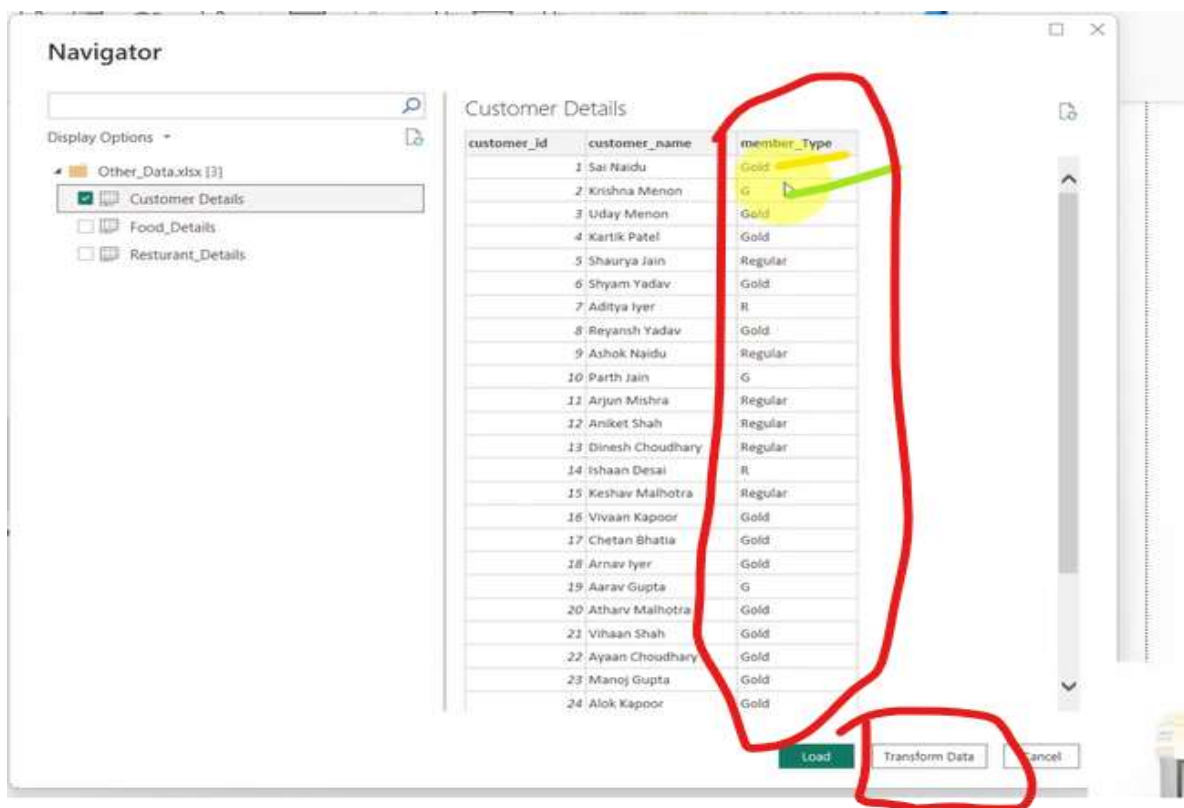

1. Click Import data from Excel

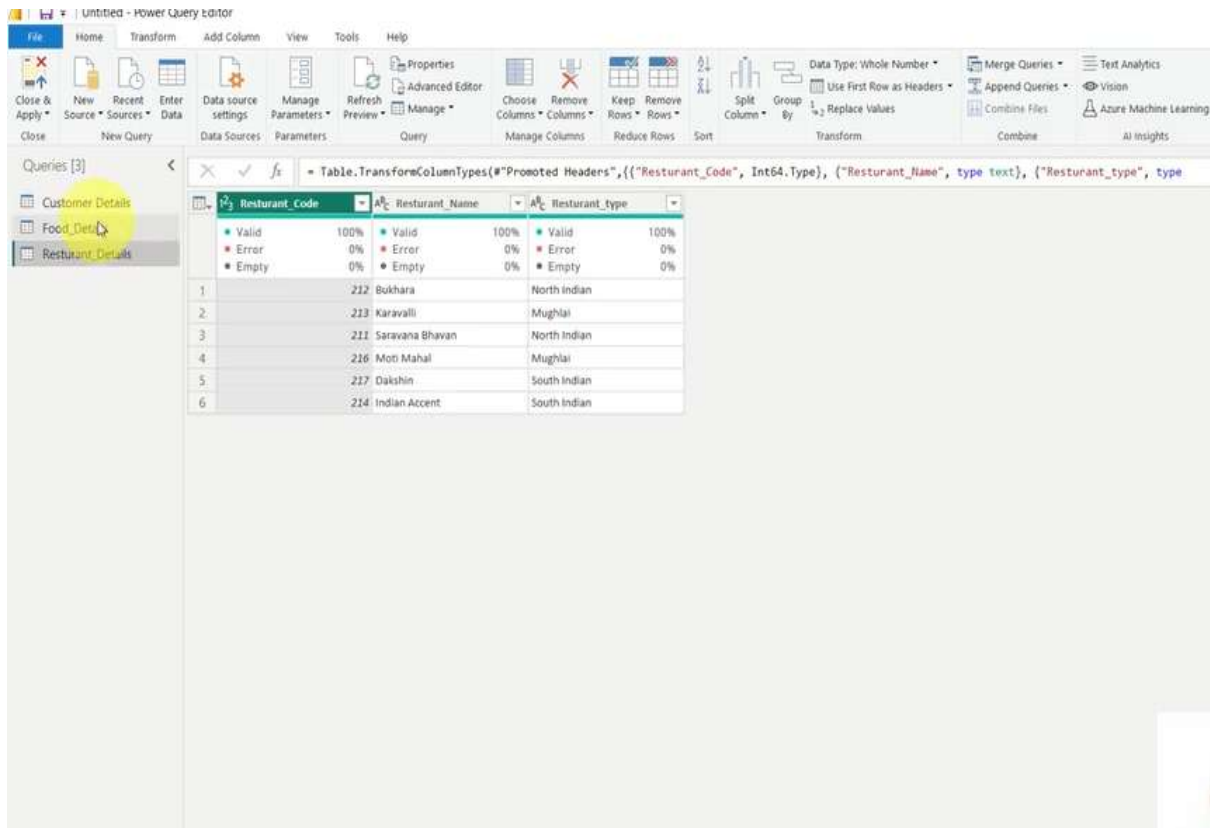

2. Select the Excel file

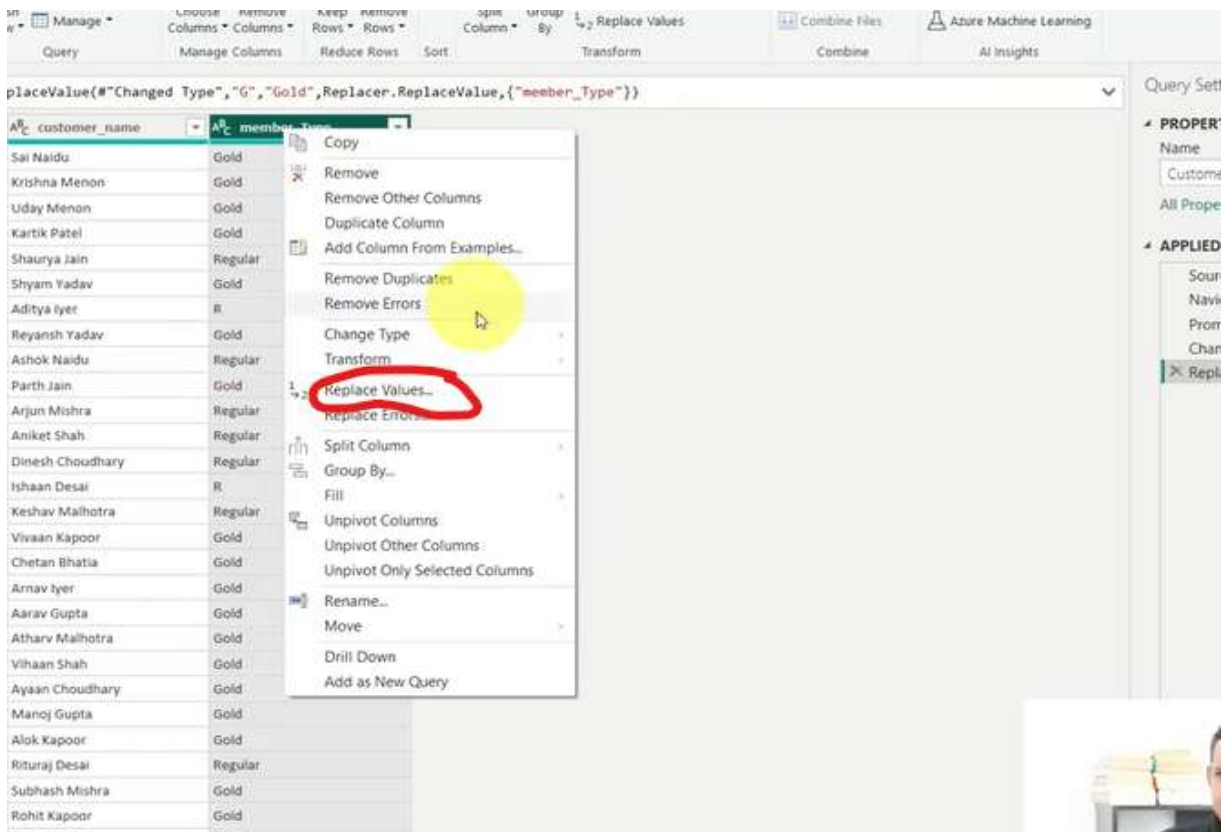

3. Click Open

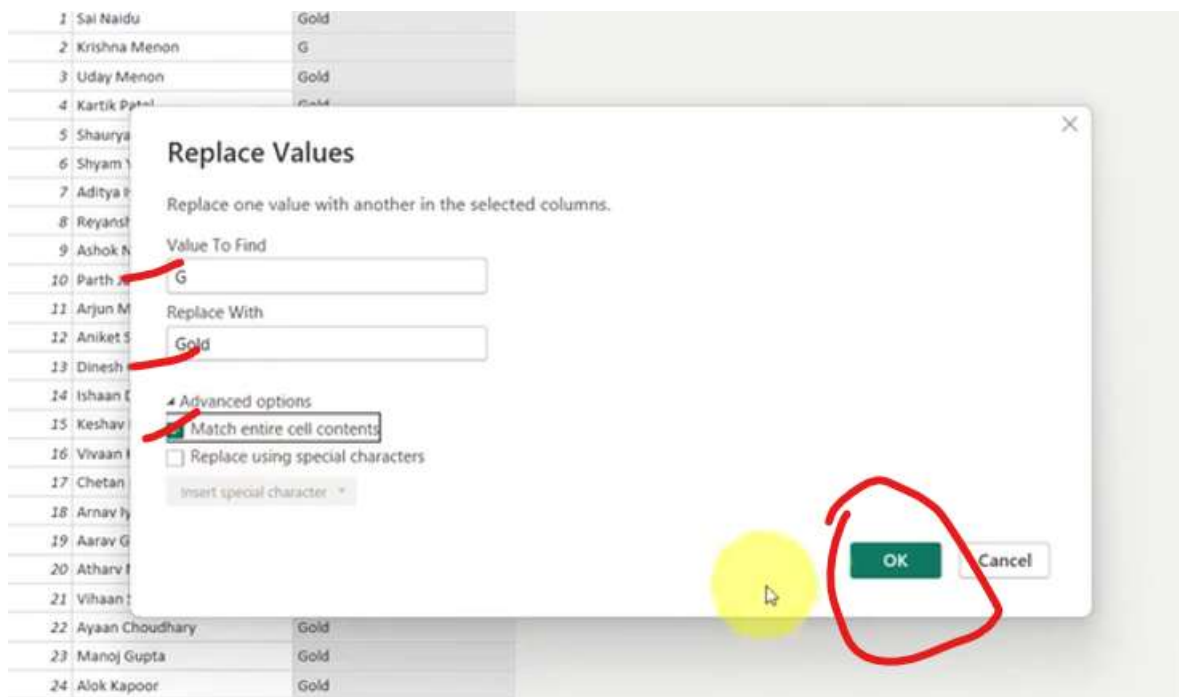

4. As the customer details file having non consistent data means some where its Gold and some where its G . So, because of these we will click transform data other files like food_details and Restuarabt_Details does not have any transform but customer_Details have so we need to transform all files and if in case files are cleaned and don't need transform than click on load .

5. Now power query window will open where all queries(files of csv file) are loaded for transformation

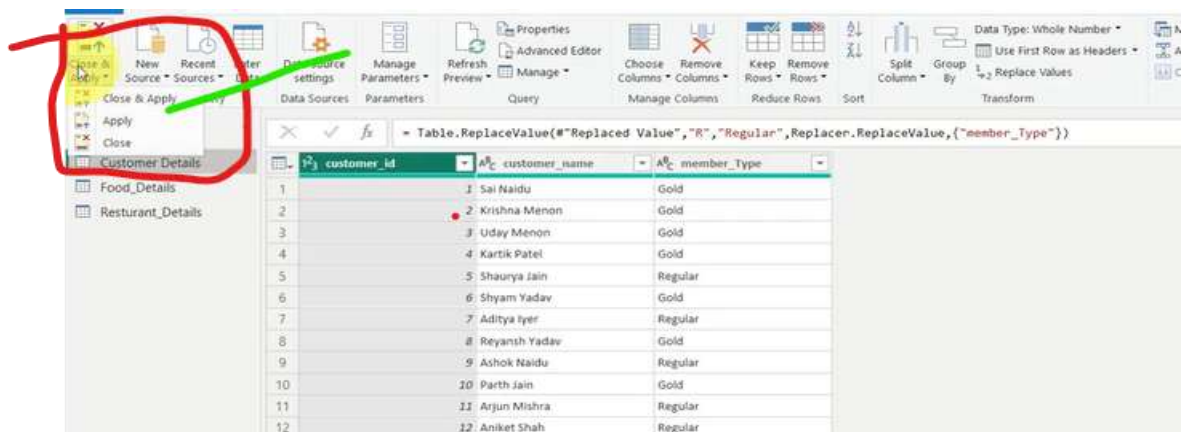

6. Now select member_Type column and right click and select Replace Values and replace G with Gold and expand Advanced option and click match entire cell contents than ok.

Now same step with R → Regular

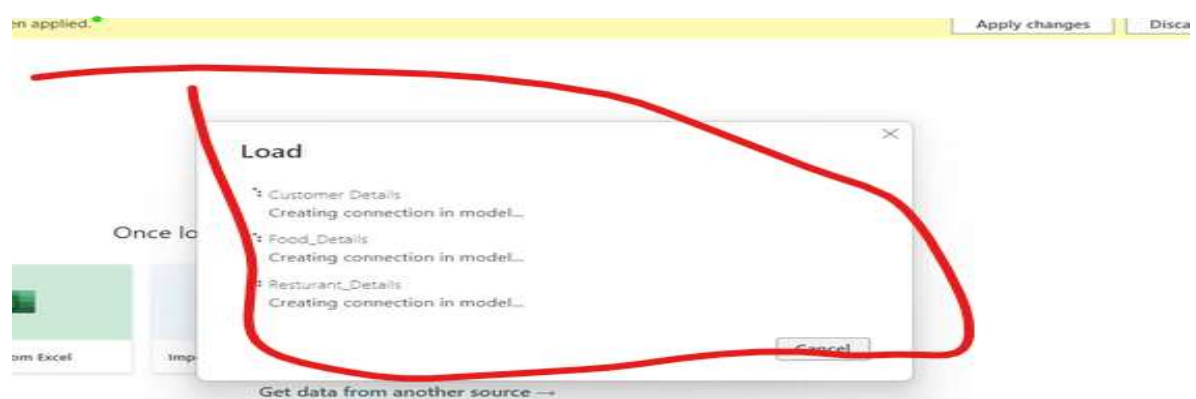

Table: ReplaceValue("#Replaced Value", "R", "Regular", Replacer.ReplaceValue, {"member_Type"})

customer_name	member_Type
1 Sai Naidu	Gold
2 Krishna Menon	Gold
3 Uday Menon	Gold
4 Kartik Patel	Gold
5 Shaurya Jain	Regular
6 Shyam Yadav	Gold
7 Aditya Iyer	Regular
8 Reyanish Yadav	Gold
9 Ashok Naidu	Regular
10 Parth Jain	Gold
11 Arjun Mishra	Regular
12 Aniket Shah	Regular
13 Dinesh Choudhary	Regular
14 Ishaan Desai	Regular
15 Keshav Malhotra	Regular
16 Vivaan Kapoor	Gold
17 Chetan Bhatia	Gold
18 Arnav Iyer	Gold
19 Aarav Gupta	Gold
20 Atharv Malhotra	Gold
21 Vihaan Shah	Gold
22 Ayaan Choudhary	Gold
23 Manoj Gupta	Gold
24 Alok Kapoor	Gold
25 Rituraj Desai	Regular
26 Subhash Mishra	Gold
27 Rohit Kapoor	Gold
28 Vikram Joshi	Gold
29 Bharat Rao	Gold
30 Rakesh Nair	Regular

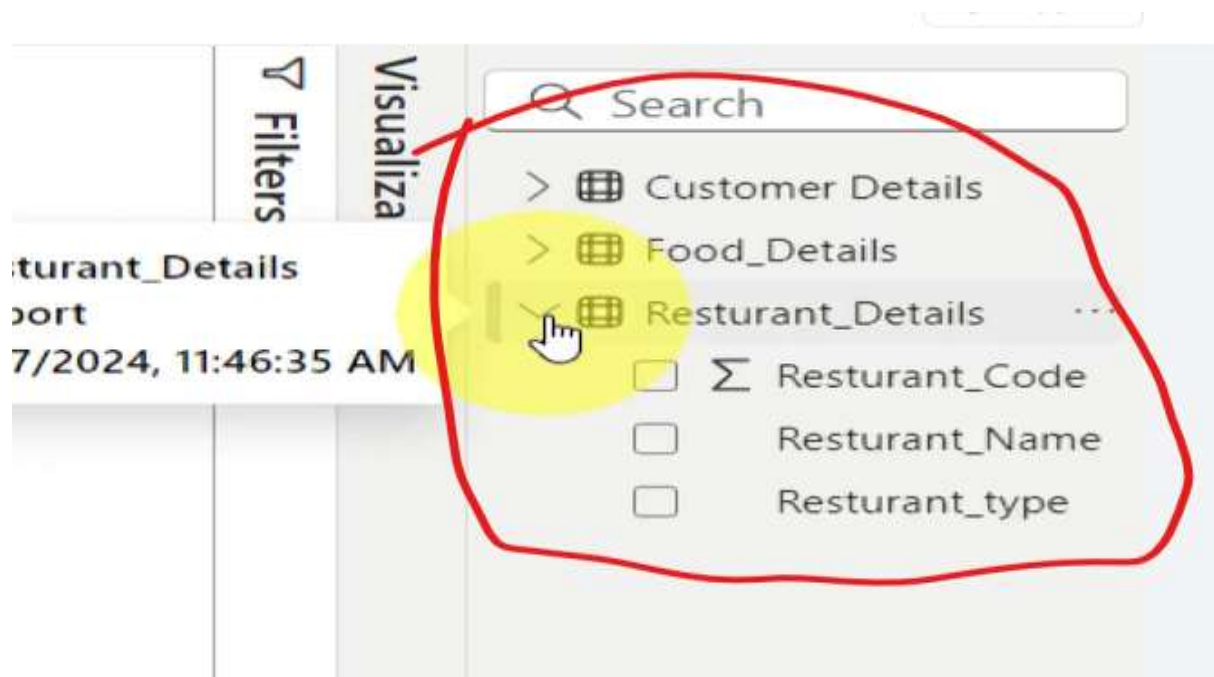

Now column is transform and consistent.

7. Now Select close and apply .

8. Now the changes we made in power query will be loaded in power BI.

9. Now on right side these are tables which are loaded in power BI

Note: In power BI we say table and in power query we say Queries.

ItemCode	Food Name	Food_Type
2142	Butter Chicken	Main Course
2152	Palak Paneer	Main Course
2145	Chole Bhature	Main Course
2149	Biryani	Main Course
2141	Masala Dosa	Breakfast
2147	Samosa	Snack
2161	Rogan Josh	Main Course
2148	Dal Tadka	Main Course
2150	Pav Bhaji	Snack
2144	Aloo Paratha	Breakfast
2165	Tandoori Chicken	Main Course
2163	Rajma	Main Course
2143	Pani Puri	Snack
2155	Gulab Jamun	Dessert
2154	Ras Malai	Dessert
2164	Vada Pav	Snack
2166	Paneer Tikka	Appetizer
2160	Lassi	Beverage
2167	Kofta Curry	Main Course
2146	Dhokla	Snack
2151	Malai Kofta	Main Course
2153	Kheer	Dessert
2162	Bhindi Masala	Main Course

We can also table from table view icon.

Now , these are the steps of importing data form excel .

Below, will understand importing data from sql server database and diff btw import query mode and direct query mode.

Interview Question

What is the difference between Import Mode and DirectQuery Mode in Power BI?

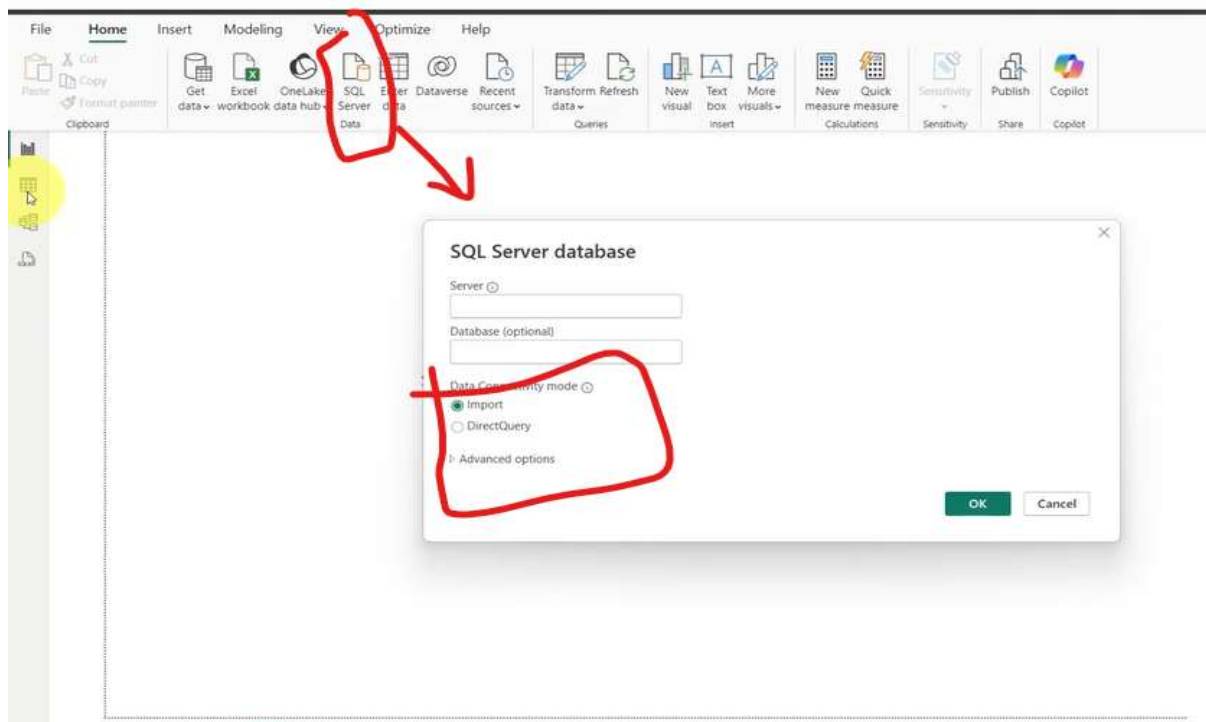

When connecting SQL Server or other databases in Power BI, two connection modes are available:

1. Import Mode
2. DirectQuery Mode

1. Import Mode

Definition

In Import Mode, data is copied from the database into Power BI.

2. DirectQuery Mode

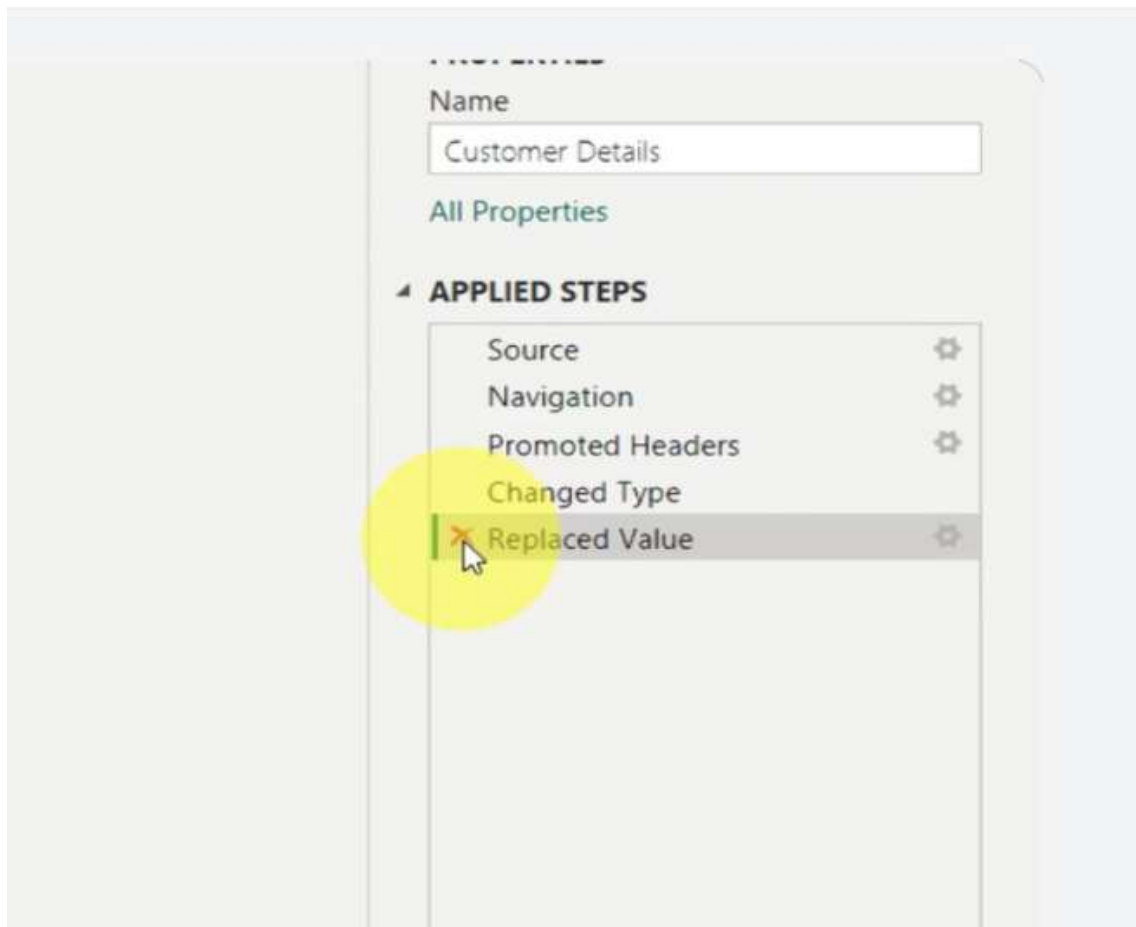

Power BI does not store data.

It directly connects to SQL Server and fetches live data.

Difference Between Import and DirectQuery

Feature	Import Mode	DirectQuery Mode
Data Storage	Stored in Power BI	Stored in Database
Speed	Fast	Slower
Data Update	Requires Refresh	Real-Time
File Size	Larger PBIX file	Smaller PBIX file
Internet Needed	No (after import)	Yes
Performance	Better	Depends on Database
Best For	Small/Medium Data	Large/Live Data

Power Query – Applied Steps and Undo Process

In Power Query, normal Ctrl + Z undo does not work like Excel.

Instead:

Power Query keeps all actions in Applied Steps.

If you want to undo:

- Go to Applied Steps
- Delete the last step

Example:

In your image:

- Source
- Navigation
- Promoted Headers
- Changed Type

- **Replaced Value**

To undo Replaced Value, click the X beside that step.

So, in Power Query:

✓ Undo = Remove Applied Step

✗ Ctrl + Z usually does not work like Excel.

Two Modes for Data Checking in Power Query

1. Filter

Filter is used to check or display specific data.

Filter Shortcut in Power Query / Excel

Shortcut Key:

Select all column and click Ctrl + Shift + L

Use:

Turns Filter ON/OFF for data columns.

Helps users analyze required data only.

Helps user check data.

2. View

View is used to see and inspect the complete data properly.

In View Option:

- **Column Quality**
- **Column Distribution**
- **Column Profile**

Use:

Helps check:

- **Null values**
- **Errors**
- **Duplicate data**

- **Data quality**

Simple Line

Power Query provides Filter and View options to check, analyze, and clean data easily.
